I think that AR is a fantastic technology with a lot of potential. I am mostly interested in it for education. I think that you could teach people a lot of things by providing AR materials and instruction. Imagine a world where someone could access historical information, instructional learning, so on and so forth all through their phone. Very inspiring.

I also think it could be useful to represent virtual structures (such as architecture) which it is already being used for. But quite literally, the capabilities are endless. Gaming, art, education…AR technology could probably be implemented into nearly every field. Archaeology and anthropology AR education could also be very interesting.
